Table 7-12. MIMO EIRP Density Summary Data (Antenna B + Antenna D)

Note:

The EIRP measurements of the co-polarized antenna arrays (Antenna A/C and Antenna B/D) were added together to address radiated MIMO concerns referenced in ANSI C63.26-2015 Section 6.4.

FCC ID: A3LAT1K02-A00	 MEASUREMENT REPORT (CERTIFICATION) 		Approved by: Quality Manager
Test Report S/N: 8K19110701-01.A3L	Test Dates: 02/18/2020-03/06/2020	EUT Type: 5G Access Unit	Page 162 of 357

7.4 RF Conducted Output Power

\$2.1046

Test Overview

RF conducted output power measurements are performed using broadband horn antennas. The conducted power is determined by maximizing the full spectrum EIRP for all component carrier configurations and then subtracting the known antenna gain from the EIRP. All measurements are performed as RMS average measurements while the EUT is operating at its maximum duty cycle, at maximum power, and at the appropriate frequencies.

Test Procedures Used

ANSI C63.26-2015 Section 5.2.4.4.1
ANSI C63.26-2015 Section 6.4

Test Settings

1. Radiated power measurements are performed using the signal analyzer's "channel power" measurement capability for signals with continuous operation.
2. RBW = 1 – 5% of the expected OBW
3. VBW $\geq$ 3 x RBW
4. Span = 2x to 3x the OBW
5. No. of sweep points $\geq$ 2 x span / RBW
6. Detector = RMS
7. The integration bandwidth was roughly set equal to the measured RF Conducted Output Power of the signal for signals with continuous operation. For signals with burst transmission, the "gating" function was enabled to ensure that measurements are performed during times in which the transmitter is operating at its maximum power
8. Trace mode = trace averaging (RMS) over 100 sweeps
9. The trace was allowed to stabilize

Test Report S/N: 8K19110701-01.A3L	Test Dates: 02/18/2020-03/06/2020	EUT Type: 5G Access Unit		Page 163 of 357

Test Notes

- 1) The EUT was tested while positioned upright and mounted on a mast at 1.5m height. The worst case emissions are reported with the EUT in this fixed position and with the modulations and active component carriers shown in the tables below.
- 2) Elements within the same antenna array are correlated to produce beamforming array gain.
- 3) Measurements were taken in the far field of the mmWave signal based on the formula: $R \geq 2D^2/\text{wavelength}$.
- 4) The test case with 1 CC active, "CC0" representing the component carrier with the lowest frequency, was selected for the worst case emission testing as it created the highest EIRP within 50MHz and 100MHz bandwidth.
- 5) The average EIRP reported below is calculated per formula specified in d) of ANSI C63.26-2015 Section 5.2.7:

$\text{EIRP (dBm)} = E (\text{dB}\mu\text{V/m}) + 20\log(D) - 104.8$; where D is the measurement distance (in the far field region) in m.

For this section, all EIRP density measurements were performed at a distance of 2.61m, so the effective correction is:

$$\begin{aligned}\text{EIRP (dBm)} &= E (\text{dB}\mu\text{V/m}) - 96.43\text{dB} \\ &= \text{Analyzer Level (dBm)} + \text{AFCL (dB/m)} + 107 \text{ dB} - 96.43\text{dB} \\ &= \text{Analyzer Level (dBm)} + \text{AFCL (dB/m)} + 10.53\text{dB}\end{aligned}$$

- 6) The conducted average power over the full channel BW is calculated as follows:
Conducted Average Power (dBm) = Average EIRP (dBm) – Antenna Gain (dBi)
- 7) Per ANSI C63.26-2015 Section 6.4, individual EIRPs are also summed before compared to the limit.
- 8) The angle of the horn antenna was rotated to maximize and find the worst case emissions. Worst case EIRP is reported below.
- 9) 7.3 Equivalent Isotropic Radiated Power (EIRP) Density plots cover for 7.4 Conducted Output Power plot.
- 10) CCs active 0, 4, 7 = 1 Components Carriers Active, 0-7 = 8 Component Carriers Active. 0-7(NC) = 8 Non-contiguous Component Carriers Active. Each component carrier's bandwidth is either of 50MHz or 100MHz Bandwidth.

7.5 Radiated Spurious and Harmonic Emissions

§2.1051 §30.203

Test Overview

Out of band emissions were scanned from 30MHz to 100GHz in a radiated test setup with the EUT operating at maximum duty cycle and power. Spurious emission plots were obtained for Low, Mid, and High operating channels. All modulations and applicable CC settings were investigated to determine worst case condition.

The conductive power or total radiated power of any emissions outside a licensee's frequency block shall be -13dBm/1MHz.

Test Procedure Used

ANSI C63.26-2015 Section 5.7.4
ANSI C63.26-2015 Section 6.4
KDB 842590 D01 v01 Section 4.4.3

Test Settings

1. Start frequency was set to 30MHz and stop frequency was set to 100 GHz. Several plots are used to show investigations in this entire span.
2. Detector = RMS
3. Trace mode = trace average
4. Sweep time = auto couple
5. Number of sweep points $\geq 2 \times \text{Span/RBW}$
6. The trace was allowed to stabilize
7. RBW = 1MHz, VBW = 1MHz

Test Notes

- 1) The EUT was tested while positioned upright and mounted on a mast 1.5m height. The worst case emissions are reported with the EUT in this fixed position and with the modulations and active component carriers shown in the tables below.
- 2) Emissions below 18GHz were measured at a 3 meter test distance, while emissions above 18GHz were measured at the appropriate far field distance. See Table 3-1 for distances used for measurements based on theoretical far field distance.
- 3) All appropriate Antenna Factors, Cable Losses, and Mixer Conversion Losses have been applied as an offset in the spectrum analyzer for each measurement.
- 4) 1CC = 1 Components Carriers Active, 8CC = 8 Component Carriers Active. 8CC NC = 8 Non-contiguous Component Carriers Active. Each component carrier's bandwidth is 100MHz.
- 5) Ch. is stands for Channel, Final is stands for Finalurement.
- 6) The angle of the horn antenna was rotated to maximize and find the worst case emissions. The worst case is reported in this section.
- 7) Spurious emissions were measured with all EUT antennas transmitting simultaneously.
- 8) Some frequency points exceed the limit which requires to investigate with TRP method for this spurious emission evaluation according to 4.4 Unwanted Emission Measurements of KDB 842590 D01.

- 9) No emissions were found below 1GHz.

TRP Measurement Procedure

If the recorded EIRP value was close or above the TRP limit, a Two Cut TRP measurement was done according to KDB 842590 D01 v01 Section 4.4.3.3.2

- a) Align the EUT with a chosen xy-plane and the xz-plane of the antenna measurement coordinate system.
 NOTE 1 For harmonics and spurious emission frequencies which are beamforming as identified in exploratory scan, it may be required to align the orthogonal cuts to include the peak based on exploratory scans.

- b) Measure the EUT dimensions, i.e., depth (d), width (w), and height (h); see Figure A.1 in Appendix A.

- c) Calculate the spherical and cylindrical diameters (D and D_{cyl}) using Equations (A.1) and (A.2) (see Appendix A).

$$D = \sqrt{d^2 + w^2 + h^2} \quad (\text{A.1})$$

$$D_{\text{cyl}} = \sqrt{d^2 + w^2} \quad (\text{A.2})$$

- d) For the highest frequency (smallest wavelength) of the frequency band measured, calculate the reference angular steps $\Delta\theta_{\text{ref}}$ and $\Delta\phi_{\text{ref}}$ using Equations (A.3) and (A.4).

$$\Delta\theta_{\text{ref}} = \min(15^\circ, 180^\circ / (\pi D / \lambda)) \quad (\text{A.3})$$

$$\Delta\phi_{\text{ref}} = \min(15^\circ, 180^\circ / (\pi D_{\text{cyl}} / \lambda)) \quad (\text{A.4})$$

- e) Set the grid spatial sampling step $\Delta\theta \leq \Delta\theta_{\text{ref}}$ for the vertical angle and $\Delta\phi \leq \Delta\phi_{\text{ref}}$ for the horizontal cut.

- f) For each emission frequency, measure the EIRP (as a sum of two orthogonal polarizations) at each spatial sampling step on the selected grid.

- g) For each emission frequency, calculate the average EIRP for both the cuts separately, and then take the average of these two average values.

- h) Add 2 dB as a correction factor to the averaged value computed in step g).

Table 7-18. Spurious Emissions (30MHz – 1GHz)

Spurious Emissions EIRP Sample Calculation

The raw radiated spurious level is converted to field strength in dBμV/m. Then, the RSE EIRP level is calculated by applying the additional factors shown below for a test distance of 3 meters.

Spurious Level [dBμV/m] = Analyzer Level [dBm] + AFCL [dB/m] + 107

= - 56.01 dBm - 22.64 dB/m + 107

= 28.35dBμV/m

RSE EIRP [dBm] = Field Strength + 20Log(D_m) – 104.8

= 28.35dBμV/m + 20Log(3) – 104.8

= -95.06dBm
