

D2342P - Block diagram

Crystal : HLX-U-F; HC-49/S(alternate)
Regulation : 14.31818MHz+/- 30PPM

DESCRIPTION OF BLOCK DIAGRAM

1. Video Controller Part.

This part amplifies the level of video signal for the digital conversion and converts from the analog video signal to the digital video signal using a pixel clock.

The pixel clock for each mode is generated by the PLL.

The range of the pixel clock is **25Mhz ~ 148.5MHz**.

This part consists of the Scaler, ADC converter, TMDS receiver and LVDS transmitter.

The Scaler gets the video signal converted analog to digital, interpolates input to **1920X1080(23")** resolution signal and outputs 8-bit R, G, B signal to transmitter.

2. Power Part.

This part consists of the one 3.3V, and one 1.2V regulators to convert power which is provided 5V in Power board.

Also, 5V is converted 3.3V and 1.2V by regulator. Converted power is provided for IC in the main board.

3. MICOM Part.

This part is include video controller part. And this part consists of EEPROM IC , control data, Reset IC and the Micom.

The Micom distinguishes polarity and frequency of the H/V sync are supplied from signal cable.

The controlled data of each modes is stored in EEPROM.
