Introduction

The measurement procedure described in MP-5 entitled "FCC Methods of Measurements of Radio Noise Emissions from Industrial, Scientific, and Medical Equipment" was used in determining frequency measurement, power output measurement, and field strength measurement emanating from **LG Electronics Inc. (GoldStar Model: *MV-1520M*) Microwave Oven FCC ID: BEJV152XD**.

These measurement tests were conducted at *PCTEST Engineering Laboratory* facility in New Concept Business Park, Guilford Industrial Park, Columbia, Maryland. The site address is 6660-B Dobbin Road, Columbia, MD 21045. The test site is one of the highest points in the Columbia area with an elevation of 390 feet above mean sea level. The site coordinates are 39°11'15" N latitude and 76°49'38" W longitude. The facility is 1.5 miles North of the FCC laboratory, and the ambient signal and ambient signal strength are approximately equal to those of the FCC laboratory. There are no FM or TV transmitters within 15 miles of the site. The detailed description of the measurement facility was found to be in compliance with the requirements of § 2.948 according to ANSI C63.4 on October 19, 1992.

Test Data (#1: LG Magnetron Model: 2M 246)

A. Input Power

The input power was measured using a RMS wattmeter. A 275ml. water load in a polypropylene beaker is placed in the center of the oven. The 275ml. of water was chosen for its compatibility with UL procedure to determine input ratings. The oven was operated at full output power for 6 minutes. The reading was taken after 6 minutes at full power.

Source	**Voltage** (VAC)	**Current** (Amps)	**Power Consumption** (Watts)	**Manufacturers Rating** (Amps)
MWO	108.9	13.96	1457	13.0
MWO + Lamp + Fan	108.2	13.78	1468	14.0

B. Power Output

The calorimetric method was used in determining the maximum output power. The test method described in MP-5 and IEC Publication 705/1988. A 1000ml. of water in a beaker was placed in the center of the oven. The oven was operated at full power.

$$P(W) = \frac{4.187 \times Q \times \Delta T}{t}$$

[ΔT = Temperature Rise in °C]
[Q = Quantity of Water in ml]
[t = Operation Time in sec.]

Quantity of Water Q = 1000ml. = 1 liter

E. Radiated Emissions

Preliminary measurements were made inside an anechoic chamber at 1 meter to determine the emission characteristics of the EUT. The EUT is configured and operated in a manner which produces the maximum emission in a typical configuration. Final measurements were made outdoors at our 3-meter test site.
