Declaration of Similarity

It is hereby declared that 4-programmable output module PGM4M is a variant of 8-programmable output module PGM8M and both models operate on 915 MHz band.

Both PGM modules have the same Layout, Electronic Hardware, Firmware and Plastic Enclosure.

The only difference between PGM4M and PGM8M is in number of outputs (output indicators, tampers and relays), some components were removed in PGM4M model because they are not required for the functionality of their specific application.

PGM4M (4 PGMs assembled on board) is a subset product of PGM8M (8 PGMs assembled on board).

The components that are removed from PGM8M and convert the product to PGM4M, are not changing the radio functions.

External and Internal photos of each model provided.

Both models have same HW and FW versions as indicated in the table low:

Brand	Model	HW Version	FW version	Description
Paradox	PGM8M	333-6007-995	V1.00	8-programmable output module
Paradox	PGM4M	333-6007-995	V1.00	4-programmable output module
